

Computational Learning Theory and Natural Learning Systems: Volume III: Selecting Good Models. Edited by Thomas Petsche, Stephen José Hanson, and Jude W. Shavlik. MIT Press, Cambridge, MA. (1995). 411 pages. \$45.00.

Contents:

Preface. Introduction. Contributors. I. Using prior knowledge. 1. Using heuristic search to expand knowledge-based neural networks (David W. Opitz and Jude W. Shavlik). 2. High accuracy path tracking by neural linearization techniques (Stefan Miesbach). 3. A preliminary PAC analysis of theory revision (Raymond J. Mooney). 4. A knowledge-based model of geometry learning (Geoffrey Towell and Richard Lehrer). II. Time-varying tasks. 5. Importance-based feature extraction for reinforcement learning (David J. Finton and Yu Hen Hu). 6. A method for constructive learning of recurrent neural networks (Dong Chen, C. Lee Giles, Gordon Sun, Mark W. Goudreau, Hsing-Hen Chen and Yee-Chun Lee). 7. Recurrent neural networks with time-dependent inputs and outputs (Volkmar Sterzing and Bernd Schürmann). III. Probabilistic concepts. 8. Soft classification, a.k.a. risk estimation, via penalized log likelihood and smoothing spline analysis of variance (Grace Wahba, Chong Gu, Yuedong Wang and Richard Chappell). 9. Learning with probabilistic supervision (Padhraic Smyth). 10. Reducing the small disjuncts problem by learning probabilistic concept descriptions (Kamal M. Ali and Michael J. Pazzani). IV. Theory. 11. On the Bayesian "Occam factors" argument for Occam's razor (David H. Wolpert). 12. Learning finite automata using local distinguishing experiments (Wei-Min Shen). 13. PAC-learnability of constrained nonrecursive logic programs (Sašo Džeroski, Stephen Muggleton and Stuart Russell). 14. Analysis of the blurring process (Yizong Cheng and Zhangyong Wan). V. Empirical comparisons. 15. Learning context to disambiguate word senses (Ellen M. Voorhees, Claudia Leacock and Geoffrey Towell). 16. Investigating the value of a good input representation (Mark W. Craven and Jude W. Shavlik). 17. Improving model selection by dynamic regularization methods (Ferdinand Hergert, William Finnoff and Hans-Georg Zimmermann). 18. Cross-validation and modal theories (Timothy L. Bailey and Charles Elkan). 19. An empirical investigation of brute force to choose features, smoothers and function approximators (Andrew W. Moore, Daniel J. Hill and Michael P. Johnson). References. Index.

Goal-Driven Learning. Edited by Ashwin Ram and David B. Leake. MIT Press, Cambridge, MA. (1995). 507 pages. \$55.00.

Contents:

Foreword by Tom Mitchell. Preface. Sources and acknowledgments. Contributors. 1. Learning, goals, and learning goals. I. Current state of the field. 2. Planning to learn (Lawrence Hunter). 3. Quantitative results concerning the utility of explanation-based learning (Steven Minton). 4. The use of explicit goals for knowledge to guide inference and learning (Ashwin Ram and Lawrence Hunter). 5. Deriving categories to achieve goals (Lawrence W. Barsalou). 6. Harpoons and long sticks: The interaction of theory and similarity in rule induction (Edward J. Wisniewski and Douglas L. Medin). 7. Introspective reasoning using meta-explanations for multistrategy learning (Ashwin Ram and Michael T. Cox). 8. Goal-directed learning: A decision-theoretic model for deciding what to learn next (Marie desJardins). 9. Goal-based explanation evaluation (David B. Leake). 10. Planning to perceive (Louise Pryor and Gregg Collins). 11. Planning and learning in PRODIGY: Overview of an integrated architecture (Jaime Carbonell, Oren Etzioni, Yolanda Gil, Robert Joseph, Craig Knoblock, Steven Minton, and Manuela Veloso). 12. A learning model for the selection of problem-solving strategies in continuous physical systems (Xiaodong Xia and Dit-Yan Yeung). 13. Explicitly biased generalization (Diana Gordon and Donald Perlis). 14. Three levels of goal orientation in learning (Evelyn Ng and Carl Bereiter). 15. Characterizing the application of computer simulations in education: Instructional criteria (Jos J.A. van Berkum, Hans Hijne, Ton de Jong, Wouter R. van Joolingen, and Melanie Njoo). II. Current research and recent directions. 16. Goal-driven learning: Fundamental issues and symposium report (David B. Leake and Ashwin Ram). 17. Storage side effects: Studying processing to understand learning (Lawrence W. Barsalou). 18. Goal-driven learning in multistrategy reasoning and learning systems (Ashwin Ram, Michael T. Cox, and S. Narayanan). 19. Inference to the best plan: A coherence theory of decision (Paul Thagard and Elijah Millgram). 20. Toward goal-driven integration of explanation and action (David B. Leake). 21. Learning as goal-driven inference (Ryszard Michalski and Ashwin Ram). Index.

Database Security. By Silvana Castano, Maria Grazia Fugini, Giancarlo Martella and Pierangela Samarati. Addison-Wesley, Wokingham, England. (1995). 456 pages. \$49.44.

Contents:

Foreword. Preface. 1. Information security. 2. Security models. 3. Basic security mechanisms and software. 4. Database security design. 5. Statistical database security. 6. Intrusion detection. 7. Security models for next-generation databases. Index.

High Performance Computing: Problem Solving with Parallel and Vector Architectures. Edited by Gary Sabot. Addison-Wesley, Reading, MA. (1995). 246 pages. \$45.14.

Contents:

Preface. About the editor. Contributors. 1. Introduction. 2. Block grid application. 3. Weather prediction: A scaleable storm-scale model. 4. Libraries for linear algebra. 5. Dynamic tree searching. 6. Connected components algorithms. 7. Mathematical programming and modeling. 8. Scalable programming in Fortran. Index.
